

AMENDMENT TO THE CLAIMS

Claim 1 (Original). A wound dressing for absorbing wound exudate, comprising:

an absorbent core defining opposed proximal and distal surfaces and at least one receptacle formed therein, the at least one receptacle opening at the distal surface of the absorbent core and extending a distance into the thickness of the absorbent core, said at least one receptacle containing a discrete portion of at least one absorbent material.

Claim 2 (Original). The wound dressing according to claim 1, wherein the absorbent core is selected from the group consisting of polymeric foam, woven material and non-woven material.

Claim 3 (Original). The wound dressing according to claim 1, wherein the absorbent material is selected from the group consisting of hydrocolloids, hydrogels and hydrophilic polymers.

Claim 4 (Original). The wound dressing according to claim 1, wherein the at least one receptacle comprises a plurality of receptacles arranged in a predetermined pattern.

Claim 5 (Original). The wound dressing according to claim 4, wherein the predetermined pattern comprises the receptacles varying in volume according to the location of each of the receptacles along the distal surface of the absorbent core.

Claim 6 (Original). The wound dressing according to claim 4, wherein the predetermined pattern is arranged so that the density of the receptacles per unit area progressively increases from the periphery towards a central portion of the absorbent core.

Claim 7 (Original). The wound dressing according to claim 4, wherein the predetermined pattern comprises the receptacles arranged in equally spaced arrays.

Claim 8 (Original). The wound dressing according to claim 1, wherein the absorbent core further comprises a plurality of discrete hydrophilic particulates enmeshed therein.

Claim 9 (Original). The wound dressing according to claim 1, wherein the at least one receptacle has a generally circular cross-section.

Claim 10 (Original). The wound dressing according to claim 1, wherein the at least one receptacle is a channel generally defined transversely along the distal surface of the absorbent core.

Claim 11 (Original). The wound dressing according to claim 1, wherein the at least one receptacle is generally cylindrical in shape.

Claim 12 (Original). The wound dressing according to claim 1, wherein the at least one receptacle extends through the entire thickness of the absorbent core.

Application No.: 10/725,560
Examiner: Lewis, Kim M.
Art Unit: 3772

Claim 13 (Original). The wound dressing according to claim 1, wherein the at least one receptacle extends a distance short of the entire thickness of the absorbent core.

Claim 14 (Original). The wound dressing according to claim 4, wherein the predetermined pattern comprises the plurality of receptacles having varying depths relative to their location to a central axis of the absorbent core.

Claims 15 - 18 (Canceled).
